# Introduction

---

## 1.1 Research Background & Objectives

To conduct a survey amongst residents in and around the London Borough of Croydon area to assess shopping habits for main food and grocery, top-up food, non-food shopping, leisure activities and local centre usage.

## 1.2 Research Methodology

A total of 800 interviews were conducted between Wednesday 13<sup>th</sup> September and Tuesday 3<sup>rd</sup> October 2023. Interviews were conducted using NEMS in-house CATI (Computer Assisted Telephone Interviewing) Unit. Respondents were contacted during the day and in the evening. All respondents were the main shopper in the household, determined using a preliminary filter question.

## 1.3 Sampling

### 1.3.1 Survey Area

The survey area was segmented into 8 zones defined by postcode sector. The zone details were:

Zone	Postcode Sectors	Number of Interviews
1	CR0 1, CR9 1, CR9 3	100
2	CR0 2, CR0 3, CR7 6	100
3	CR7 7, CR7 8, SE16 3, SE16 4	100
4	SE19 2, SE19 3, SE25 4, SE25 5, SE25 6	100
5	CR0 5, CR0 6, CR0 7, CR0 8	100
6	CR2 6, CR2 7, CR9 4	100
7	CR0 0, CR0 9, CR2 0, CR2 8, CR2 9, CR9 5, CR9 6	100
8	CR5 1, CR5 2, CR5 3, CR8 5, CR8 1, CR8 2, CR8 3, CR8 4	100
<b>Total</b>		<b>800</b>

### 1.3.2 Telephone Numbers

The **landline** numbers are generated through a process known as Random Digit Dialling (RDD), whereby we start with known 'seed' numbers and then generate all possible number combinations around these. Known business numbers are removed and the remaining numbers are randomly sorted to give each number the same and equal chance of being selected.

The benefit of using RDD numbers (as opposed to those generated from pre-existing lists such as telephone directories and Electoral Register entries) is that ex-directory numbers are also included in the survey sample. In practice, this means that the sample provided is in no way preselected, and that consumers who had opted-out of providing their telephone contact details to directory operators had the opportunity to take part in the research, thereby removing potential bias in the sample.

**Mobile** numbers were also included in the survey sample to further increase the inclusivity of the survey, given the increase in the number of mobile-only households amongst certain demographic groups (especially younger people and lower income households). These numbers are generated from a variety of commercial sources, where permission has been given to use such contact information for research and marketing purposes.

We don't screen against the TPS (Telephone Preference Service) database, again because the demographic profile of TPS registered numbers is slightly different to the rest of the population. In addition, there is no legal requirement to screen against TPS registered numbers; market research is not classified as unsolicited sales and marketing.

### 1.3.3 Time of Interviewing

Approximately two-thirds of all calls are made outside normal working hours.

### **1.3.4 Sample Profile**

It should be noted that as per the survey's requirements, the profile of respondents is that of the main shopper / person responsible for most of the food shopping in the household. As such it will always differ from the demographic profile of all adults within the survey area. With any survey among the main shopper / person responsible for most of the food shopping in the household the profile is typically biased more towards females and older people. The age of the main shopper / person responsible for most of the food shopping in the household is becoming older due to the financial constraints on young people setting up home.

A number of measures are put in place to ensure the sample is representative of the profile of the person responsible for most of the food / shopping in the household.

First of all, interviewing is normally spread over a relatively long period of time, certainly longer than the theoretical minimum time it would take. This allows us time to call back people who weren't in when we made the first phone call. If we only interview people who are at home the first time we call, we over-represent people who stay at home the most; these people tend to be older / less economically active.

We also control the age profile of respondents; this is a two-stage process. First of all, we look at the age profile of the survey area according to the latest Census figures. Using a by-product from additional data we collect from a weekly telephone survey of a representative sample of all adults across the country we know the age profile of the main shopper in any given area. This information is from data based on in excess of 100,000 interviews and is regularly updated and is therefore probably the most accurate and up to date information of its kind.

Stratified random sampling helps ensure that the sample is as representative as possible. While the system dials the next randomly selected number for interviewers, all calls are made by interviewers; no automated call handling systems are used.

### **1.3.5 Monitoring of Calls**

At least 5% of telephone interviews are randomly and remotely monitored by Team Leaders to ensure the interviewing is conducted to the requisite standard. Both the dialogue and on-screen entries are monitored and evaluated. Interviewers are offered re-training should these standards not be met.

## 1.4 Weightings

To correct the small differences between the sample profile and population profile, the data was weighted. The population is of the main shopper in the household. Weightings have been applied to age bands based on an estimated age profile of main shoppers (see section 1.3.3 for details). The weighted totals differ occasionally from the adjusted population due to rounding error. Details of the age weightings are given in the table below:

Age	Main Shopper Profile (%)	Interviews Achieved	Age Weightings
18-34	25.3	150	1.3515
35-44	21.5	123	1.4005
45-54	18.5	52	2.8492
55-64	16.3	136	0.9604
65+	18.3	339	0.4313
<b>Total</b>		<b>800</b>	

Further weightings were then applied to the zone date, to adjust zone samples to be representative by population. Details of those weightings are given in the table below:

Zone	Population *	Interviews Achieved	Interviews Achieved (Weighted by Age)	Zone Weightings
1	13,464	100	54	0.4840
2	54,281	100	113	0.9291
3	59,804	100	109	1.0630
4	56,449	100	104	1.0507
5	63,225	100	99	1.2438
6	40,215	100	101	0.7734
7	58,523	100	115	0.8954
8	66,470	100	105	1.2312
<b>Total</b>	<b>412,431</b>	<b>800</b>	<b>800</b>	

\* Source: Census 2011

## 1.5 Statistical Accuracy

As with any data collection where a sample is being drawn to represent a population, there is potentially a difference between the response from the sample and the true situation in the population as a whole. Many steps have been taken to help minimise this difference (e.g. random sample selection, questionnaire construction etc) but there is always potentially a difference between the sample and population – this is known as the standard error.

The standard error can be estimated using statistical calculations based on the sample size, the population size and the level of response measured (as you would expect you can potentially get a larger error in a 50% response than say a 10% response simply because of the magnitude of the numbers).

To help understand the significance of this error, it is normally expressed as a confidence interval for the results. Clearly to have 100% accuracy of the results would require you to sample the entire population. The usual confidence interval used is 95% - this means that you can be confident that in 19 out of 20 instances the actual population behaviour will be within the confidence interval range.

*For example, if 50% of a sample of 800 answers “Yes” to a question, we can be 95% sure that between 46.5% and 53.5% of the population holds the same opinion (i.e. +/- 3.5%).* The following is a guide showing confidence intervals attached to various sample sizes from the study:

%ge Response	95% confidence interval
10%	±2.1%
20%	±2.8%
30%	±3.2%
40%	±3.4%
50%	±3.5%

## 1.6 Data Tables

Tables are presented in question order with the question number analysed shown at the top of the table. Those questions where the respondent is prompted with a list of possible answers are indicated in the question text with a suffix of [PR].

The sample size for each question and corresponding column criteria is shown at the base of each table. A description of the criteria determining to whom the question applies is shown in italics directly below the question text; if there is no such text evident then the question base is the full study sample. If the tabulated data is weighted (indicated in the header of the tabulations), in addition to the sample base, the weighted base is also shown at the bottom of each table.

Unless indicated otherwise in the footer of the tabulations, all percentages are calculated down the column. Arithmetic rounding to whole numbers may mean that columns of percentages do not sum to exactly 100%. Zero per cent denotes a percentage of less than 0.05%.

Percentages are calculated on the number of respondents and not the number of responses. This means that where more than one answer can be given to a question the sum of percentages may exceed 100%. All such multi-response questions are indicated in the tabulated by a suffix of [MR] on the question text.

Where appropriate to the question, means are shown at the bottom of response tables. These are calculated in one of two ways: if the data is captured to a coded response a weighted mean is calculated and the code weightings are shown as a prefix above the question text; if actual specific values were captured from respondents these individual numbers are used to calculate the mean.
